The present invention describes composition of matter (I) comprising an Fe domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2.

(L1)c-P1-(L2)d-P2-(L3)e-P^3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently control of the composition of the converted conver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemic; dermatological; immunosuppressive; anti-inflammatory; linker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;

```
The present invention describes composition of matter (I) comprising an (XI)a-F1-(XI)b, where: FI = an Fc domain, XI and X2 = are each independently selected from -(LI)c-P1-(LI)c-P1-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(LI)d-P2-(
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAA69443
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A binding, complement fixation, and possibly placental transfer. AAA6944 to AAA69226 and AAB16955 to AAB18003 represent nuclectide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps

The present intrentation describes composition of marter (1) comprising an (X1)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, (L3)e-P2-(L3)e-P2-(L3)e-P3-(L4)f-P4 (L1)c-P1-(L2)d-P2, (L3)e-P3-(L3)e-P3-(L4)f-P4 (P4)ere P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and and b is 1. The composition can cartivities. DNAs, vectors and host cells from the present invention can activities. DNAs, vectors and host cells from the present invention can cused for producing pharmaceutical compositions. The compositions are the used for producing pharmaceutical compositions. The compositions are the use of an Fc domain (rather than a Fab domain) can provide a longer (C be use of an Fc domain (rather than a Fab domain) can provide a longer that incorporate functions such as Fc receptor binding, protein CC A binding, complement fixation, and possibly placental transfer. The present invention describes composition of matter (I) comprising an CC Fc domain, pharmacologically active peptides, and linkers. Where (I) is: Cr (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each (X1)a-F1-(X2)b, where (I) = an Fc domain; X1 and X4 = are each independently selected from (-(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 (-(L3)d-P2-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0

The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)C-P1-(L2)d-P2.

(L1)C-P1-(L2)d-P2-(L3)e-P^3, or -(L1)C-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of independently linkers; and a, b, c, d, e, and f = are each independently inversion or 1. provided that at least 1 of a and b is 1. The composition can activities. DNAs, vectors and host cells from the present invention can activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions.

CC os 1. provided that will be active the present invention can activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions.

CC os 1. provided that will be active the composition can be used for producing pharmaceutical composition.

CC of the use of an FC domain (rather than a Fab domain) can provide a longer composition can be active to a producing cancer invention, and possibly placental transfer. AAA69443 cc sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunoglobulin; IgG1; Fc; thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anaemic; dermatological; immunosuppressive; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP_1-(L_1)_nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Thrombopoietic peptides which activate mpl receptors and increase the

The present invention describes composition of matter (I) comprising an (X) are domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)C-F1, -(L1)C-F1 -(L2)d-F2, -(L3) -P-7, or -(L1)C-F1 -(L2)d-F2 -(L3) = P-7, or -(L1)C-F1 -(L2)d-F2 -(L3) = P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently
pharmacologically active.peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently no or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer that incorporate functions such as Fc receptor binding, protein Abifalie or incorporate functions such as Fc receptor binding, protein to AAA69526 and AAB18033 represent nucleotide and amino acid sequences used in the exemplification of the present invention.

O or 1, provided that at least 1 of a and b is 1. The composition can activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Fcb domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein to Abinding, complement fixation, and possibly placental transfer. AA69443 sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Thrombopoietin; mimetic; TMP; TPO; platelet; megakaryocyte; production; anti-human immunodeficiency virus; anti-HIV; anti-anemnic; dermatological; immunosuppressive; anti-inflammatory; linker; cyclic; linear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP_1-(L_1)_nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least
                                                                                                                                                                                                                        .;

pharmacologically active peptides; L1, L2, L3, and L4 = are each independently independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive be used for producing pharmacoutical compositions. The compositions are be used for producing pharmacoutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC obmain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein Abinding, complement fixation, and possibly placental transfer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Thrombopoietic peptides which activate mpl receptors and increase the production of platelets or platelet precursors, useful for treatment of diseases which involve thombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A compound which binds to an mpl receptor comprising a thrombopoietin mimetic peptide (TMP) dimer joined by a linker [TMP_1-(L_1],nTMP_2], is new. TMP_1 and TMP_2 are amino acid sequences varying from at least
                                                                                                                                                              A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                    Gaps

FC domain, pharmacologically active peptides, and linkers. Where (I) is: FC domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-F1-(X2)b. where: F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, (L3)e-P3, r1, r1, r2-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 are each independently sequences of where P1, P2, P3, and P4 = are each independently pharmacologically active peptides; L1, L2, L3, and L4 = are each independently inkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently inkers; and a, b, c, d, e, and f = are each independently have cytostatic, antiasthmatic, thrombolytic and immunosuppressive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes composition of matter (I) comprising an
O or 1, provided that at least 1 of a and b is 1. The composition can arterial solutions and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69226 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLAA, minetic; LT.1; TNF; antagonist; antwp; inhibitor; erythropoietin; thrombopoietin; interleukin is cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase;

Fc domain, pharmacologically active peptides, and linkers. Where (I) is: Fc domain, pharmacologically active peptides, and linkers. Where (I) is: Mand XI are each (XI)a-F1-(X2)b, where FI = an Fc domain; XI and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4-(L1)c-P1-(L2)d-P2-(L3)e-P3-(L3)e-P3-(L4)f-P4-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(L3)e-P3-(
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes composition of matter (I) comprising an
activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer than I rate of incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               autoimmune disease; cytostatic; antiasthmatic; thrombolytic: VEGF; immunosuppressive; BPO; TPO; CTLA4; minetic; IL-1; TNF; antagonist; wWRP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases

The present invention describes composition of matter (I) comprising an (X1) are I (X2) b, where: F1 = an Fc domain; X1 and X2 = are each (X1) are I (X2) b, where: F1 = an Fc domain; X1 and X2 = are each (X1) b, where I b, P2 (X1) b, where (I) is: (X1) c-P1 (L2) d-P2 (L3) d-P
useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.

The present invention describes composition of matter (I) comprising an (X1)4-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each (X1)4-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each (X1)4-F1-(X2)b, where (I) is: independently selected from - (L1)c-P1, -(L1)c-P1-(L2)d-P2.

"Ul)c-P1-(L2)d-P2-(L3)d-P^3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of independently linkers; and a, b, c, d, e, and I4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each invention can activities. DNAs, vectors and host cells from the present invention can useful for treating cancer, asthma, thrombosit.ons The compositions are the use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein can binding, complement fixation, and possibly placental transfer. AAA69443 exquences used in the exemplification of the present invention.
                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                  autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and

Where (I) is: CC (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(Li)c-F1-(Li)d-P2, [Li]d-P2, [Li]
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
